MEDIA RELEASE

Beagle Internet launches 3G Secure Wireless

Beagle Internet today announced the release of its 3G Secure Wireless Broadband service which covers 96% of the Australian population using the Optus 3G wireless mobile broadband network.

This new product utilizes innovative proprietary in-house technology developed by Beagle Internet in Australia. Security protection is delivered to users at a network level without the need to install and maintain expensive and complicated security software on their computer.

Beagle's security product combines a network firewall, email anti-virus/anti-spam protection and web filtering to prevent infection from spy ware, viruses and Trojans through the Internet.

Beagle is to our knowledge, the only service provider in Australia to offer this type of innovative service to retail consumers.

Beagle Internet Customer Service Manager, Keith Kennedy noted that *"Many consumers are unaware that most 3G wireless services connect their computer directly to the Internet without any basic protection mechanisms such as those found in ADSL modems. Our 3G Secure Wireless product provides protection at a fraction of the cost of most desktop security software. Also, as our service is completely network based, it eliminates common mistakes we see with desktop security software such as blocking of all access or reduction in protection through accidental misconfiguration"*.

The protection is available as a value added option for just \$1.95 per month in association with Beagle's class leading Unleashed 1GB, 3GB or 5GB plans which start at just \$18.95 per month.

About Beagle Internet

Beagle Internet Pty Ltd was established in 2004 to create a high quality, low cost dial-up Internet service provider. Beagle has built a loyal following in the dial-up space where it has a market leader by offering an inexpensive service coupled with responsive and personalized customer support and value-added services. In 2006, Beagle expanded into offering ADSL broadband and in 2009, this has been extended further to ADSL2+ broadband. In 2006, Beagle was recognized by APC magazine for offering one of the top 5 entry level broadband plans and by the Australian Bureau of Statistics as one of the only actively growing dial-up ISPs.

In August 2009, Beagle Internet was recognized as one of Australia's top 20 ISPs by the popular Whirlpool and Broadband Choice websites.
